    return d;
}

```

## 2.5 Fast Subset Transform

\* Author: Lucian Bicsi  
 \* Description: Transform to a basis with fast convolutions of the form  
 \*  $\displaystyle c[z] = \sum_{\text{nolimits}} \{z = x \oplus y\} a[x] \cdot b[y]$ ,  
 \* where  $\oplus$  is one of AND, OR, XOR. The size of  $a$  must be a power of two.

```

* Time:  $O(N \log N)$ 
* Também chamada de Transformada Rápida de Walsh-Hadamard
*/

```

```

void FST(vi& a, bool inv) {
    for (int n = sz(a), step = 1; step < n; step *= 2) {
        for (int i = 0; i < n; i += 2 * step) rep(j, i, i + step) {
            int &u = a[j], &v = a[j + step]; tie(u, v) =
                // inv ? pii(v - u, u) : pii(v, u + v); // AND /// include-line
                // inv ? pii(v, u - v) : pii(u + v, u); // OR /// include-line
                // pii(u + v, u - v); // XOR /// include-line
        }
        // if (inv) for (int& x : a) x /= sz(a); // XOR only /// include-line
    }
}

vi conv(vi a, vi b) {
    FST(a, 0); FST(b, 0);
    rep(i, 0, sz(a)) a[i] *= b[i];
    FST(a, 1); return a;
}

```

## 2.6 FFT

```

struct FFT{
    typedef complex<double> C;
    typedef vector<double> vd;
    typedef vector<long long int> vl;
    typedef vector<int> vi;

    /*
    * Author: Ludo Pulles, chilli, Simon Lindholm
    * Date: 2019-01-09
    * License: CC0
    * Source: http://neerc.ifmo.ru/trains/toulouse/2017/fft2.pdf (do read, it's
    → excellent)
    Accuracy bound from http://www.daemonology.net/papers/fft.pdf
    * Description: fft(a) computes  $\hat{f}(k) = \sum_x a[x] \exp(2\pi i \cdot k \cdot x / N)$  for all  $k$ .  $N$  must be a power of 2.
    →  $x / N$ 
    Useful for convolution:
    \texttt{conv(a, b) = c}, where  $c[x] = \sum a[i]b[x-i]$ .
    For convolution of complex numbers or more than two vectors: FFT, multiply
    pointwise, divide by n, reverse(start+1, end), FFT back.
    Rounding is safe if  $(\sum a_i^2 + \sum b_i^2) \log_2 N < 9 \cdot 10^{14}$ 
    (in practice  $10^{16}$ ; higher for random inputs).
    */
}

```

```

Otherwise, use NTT/FFTMod.
* Time:  $O(N \log N)$  with  $N = |A| + |B|$  ( $\tilde{1s}$  for  $N = 2^{22}$ )
* Status: somewhat tested
* Details: An in-depth examination of precision for both FFT and FFTMod can
→ be found
    * here
→ (https://github.com/simonlindholm/fft-precision/blob/master/fft-precision.md)
*/

### 3.7 Euler Path

\* Author: Simon Lindholm  
\* Date: 2019-12-31  
\* License: CC0  
\* Source: folklore  
\* Description: Eulerian undirected/directed path/cycle algorithm.  
\* Input should be a vector of (dest, global edge index), where  
\* for undirected graphs, forward/backward edges have the same index.  
\* Returns a list of nodes in the Eulerian path/cycle with src at both start and  
↪ end, or  
\* empty list if no cycle/path exists.  
\* To get edge indices back, add .second to s and ret.

```

* Time:  $O(V + E)$ 
* Status: stress-tested
*
* Condições para a existencia de um caminho/cicutio euleriano:
*
*      | Direcionado | Não Direcionado
* -----+-----+-----
*      | "existem 0 ou 1 vértices |
* Caminho | com diferença 1 entre grau | "existem 0 ou 2 vértices de grau ímpar"
*      | de entrada e saída" |
* -----+-----+-----
*      | "Grau de entrada e saída |
* Circuito | de todos os vértices | "não existe vértice de grau ímpar"
*      | são iguais" |
*
*/

```

```

    pai[a] = b;
}

};

```

---

## 8 Extra

### 8.1 BitOperators.h

Pra fazer funcionar com `long long` é só colocar `ll` no `final` da função, por exemplo  
 ↳ `"_builtin_clz(x)"` vira `"_builtin_clzll(x)"`  
`__builtin_clz(x)`: Count leading zeros. Retorna o número de zeros no início da  
 ↳ representação binária de `x` (incio == bits mais significativos)  
`__builtin_ctz(x)`: Count trailing zeros. Retorna o número de zeros no `final` da  
 ↳ representação binária de `x`  
`__builtin_popcount(x)`: Population count. Retorna o número de bits definidos como `1`  
 ↳ na representação binária de `x`  
`__builtin_parity(x)`: Parity. Retorna `1` se o número de bits definidos como `1` `for`  
 ↳ ímpar e `0` se `for` par.  
`int L = 32 - __builtin_clz(n)`, `n = 1 << L`; : `"n"` se torna a primeira potencia de `2`  
 ↳ estritamente maior que `n`

---

### 8.2 XorBasis.h

```

//Xor Basis

struct Basis{
    vector<int> basis;
    Basis(){

    }
    Basis(int x){
        add(x);
    }
    Basis operator+(Basis other) const{
        Basis res;
        for(int x : basis){
            res.add(x);
        }
    }
}

```

---

```

for(int x : other.basis){
    res.add(x);
}
return res;
}

void add(int x){
    for(auto& i : basis){
        x = min(x, x^i);
    }
    if(x){
        basis.push_back(x);
    }
}
};

```

---

### 8.3 TernarySearch.h

```

//Ternary Search

double ternary(double l, double r){
    // < for maximum and > for minimum value
    int cont = 300;
    while (cont --)
    {
        double m1 = l + (r-l)/3;
        double m2 = r - (r-l)/3;
        double f1 = f(m1);
        double f2 = f(m2);
        if(f1>f2){
            l = m1;
        }else{
            r = m2;
        }
    }
    return l;
}

/**
 * Author: Simon Lindholm
 * Date: 2015-05-12
 * License: CC0
 * Source: own work
 * Description:

```

```

* Find the smallest i in [a,b] that maximizes f(i), assuming that f(a) < \dots
↳ < f(i) \ge \dots \ge f(b).
* To reverse which of the sides allows non-strict inequalities, change the < marked
↳ with (A) to <=, and reverse
* the loop at (B).
* To minimize f$, change it to >, also at (B).
* If you are dealing with real numbers, you'll need to pick $m_1 = (2a + b)/3.0$
↳ and $m_2 = (a + 2b)/3.0$.
* Consider setting a constant number of iterations for the search, usually
↳ $[200,300]$ iterations are sufficient
* for problems with error limit as $10^{-6}$.
* Status: tested
* Usage: int ind = ternSearch(0,n-1,[\&](int i){return a[i];});
* Time: O(\log(b-a))
*/

int ternSearch(int a, int b) {
    assert(a <= b);
    while (b - a >= 5) {
        int mid = (a + b) / 2;
        if (f(mid) < f(mid+1)) a = mid; // (A)
        else b = mid+1;
    }
    for(int i = a+1; i <= b; ++i)
        if (f(a) < f(i)) a = i; // (B)
    return a;
}
