1 Matematica

1.1 Identidades

Series

$$\sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6} \quad \sum_{i=1}^n i^3 = \frac{n^2(n+1)^2}{4} = \left(\sum_{i=1}^n i\right)^2$$

$$g_k(n) = \sum_{i=1}^n i^k = \frac{1}{k+1} \left(n^{k+1} + \sum_{j=1}^k \binom{k+1}{j+1} (-1)^{j+1} g_{k-j}(n) \right)$$

$$\sum_{i=0}^n ic^i = \frac{nc^{n+2} - (n+1)c^{n+1} + c}{(c-1)^2}, \quad c \neq 1$$

$$\sum_{i=0}^{\infty} ic^i = \frac{c}{(1-c)^2}, \quad |c| < 1$$

Binomial Identities

- $\binom{n}{k} = \frac{n}{k} \binom{n-1}{k-1} = \binom{n-1}{k-1} + \binom{n-1}{k}$
- $\binom{n}{h} \binom{n-h}{k} = \binom{n}{k} \binom{n-k}{h}$
- $\sum k \binom{n}{k} = n2^{n-1}$
- $\sum_{j=0}^k \binom{m}{j} \binom{n-m}{k-j} = \binom{n}{k}$
- $\sum_{m=k}^n \binom{m}{k} = \binom{n+1}{k+1}$
- $(x+y)^n = \sum \binom{n}{k} x^{n-k} y^k$

$$\sum k^2 \binom{n}{k} = (n+n^2)2^{n-2}$$

$$\sum \binom{m}{j}^2 = \binom{2m}{m}$$

$$\sum_{k=0}^{\lfloor n/2 \rfloor} \binom{n-k}{k} = F_{n+1}$$

$$(1+x)^n = \sum \binom{n}{k} x^k$$

Progressão Aritmética (PA)

Termo Geral: $a_n = a_1 + (n-1)r$
Soma dos Termos: $S_n = \frac{(a_1+a_n)n}{2}$
PA de 2ª Ordem: $a_n = An^2 + Bn + C$

Progressão Geométrica (PG)

Termo Geral: $a_n = a_1 \cdot q^{n-1}$
Soma Finita: $S_n = a_1 \frac{q^n - 1}{q - 1}$
Soma Infinita ($|q| < 1$): $S_{\infty} = \frac{a_1}{1-q}$

Funções Geradoras

$$(1+x)^n = \sum_{k \geq 0} \binom{n}{k} x^k$$

$$\frac{1}{(1-x)^{m+1}} = \sum_{k \geq 0} \binom{k+m}{m} x^k$$

$$\frac{x^m}{(1-x)^{m+1}} = \sum_{k \geq 0} \binom{k}{m} x^k$$

1.2 Number Theory

Identities

$$\sum_{d|n} \varphi(d) = n$$

$$\sum_{\substack{i < n \\ \gcd(i,n)=1}} i = n \cdot \frac{\varphi(n)}{2}$$

$$|\{(x,y) : 1 \leq x,y \leq n, \gcd(x,y) = 1\}| = \sum_{d=1}^n \mu(d) \left\lfloor \frac{n}{d} \right\rfloor^2$$

$$\sum_{x=1}^n \sum_{y=1}^n \gcd(x,y) = \sum_{k=1}^n k \sum_{k|l} \left\lfloor \frac{n}{l} \right\rfloor^2 \mu\left(\frac{l}{k}\right)$$

$$\sum_{x=1}^n \sum_{y=x}^n \gcd(x,y) = \sum_{g=1}^n \sum_{g|d} d \cdot \varphi\left(\frac{d}{g}\right)$$

$$\sum_{x=1}^n \sum_{y=1}^n \text{lcm}(x,y) = \sum_{d=1}^n d \mu(d) \sum_{d|l} l \left(\left\lfloor \frac{n}{l} \right\rfloor + 1 \right)^2$$

$$\sum_{x=1}^n \sum_{y=x+1}^n \text{lcm}(x,y) = \sum_{g=1}^n \sum_{g|d} d \cdot \varphi\left(\frac{d}{g}\right) \cdot \frac{d}{g} \cdot \frac{1}{2}$$

$$\sum_{x \in A} \sum_{y \in A} \gcd(x,y) = \sum_{t=1}^n \left(\sum_{l|t} \frac{t}{l} \mu(l) \right) \left(\sum_{t|a} \text{freq}[a] \right)^2$$

$$\sum_{x \in A} \sum_{y \in A} \text{lcm}(x,y) = \sum_{t=1}^n \left(\sum_{l|t} \frac{l}{t} \mu(l) \right) \left(\sum_{a \in A, t|a} a \right)^2$$

Large Prime Gaps

For numbers until 10^9 the largest gap is 400.
 For numbers until 10^{18} the largest gap is 1500.

Prime counting function - $\pi(x)$

The prime counting function is asymptotic to $\frac{x}{\log x}$, by the prime number theorem.

x	10	10 ²	10 ³	10 ⁴	10 ⁵	10 ⁶	10 ⁷
$\pi(x)$	4	25	168	1 229	9 592	78 498	664 579

Some Primes

999999937 1000000007 1000000009 1000000021
 1000000033 $10^{18} - 11$ $10^{18} + 3$ 2305843009213693951 = $2^{61} - 1$

Number of Divisors

n	6	60	360	5040	55440	720720	4324320
d(n)	4	12	24	60	120	240	384
n	367567200	6983776800	13967553600	321253732800			
d(n)	1152	2304	2688	5376			

$18401055938125660800 \approx 2e18$ is highly composite with 184320 divisors.

For numbers up to 10^{88} , $d(n) < 3.6 \sqrt[3]{n}$.

Lucas's Theorem

$$\binom{n}{m} \equiv \prod_{i=0}^k \binom{n_i}{m_i} \pmod{p}$$

For p prime. n_i and m_i are the coefficients of the representations of n and m in base p . In particular, $\binom{n}{m}$ is odd if and only if n is a submask of m .

Fermat's Theorems

Let p be a prime number and a an integer, then:

$$a^p \equiv a \pmod{p}$$

$$a^{p-1} \equiv 1 \pmod{p}$$

Lemma: Let p be a prime number and a and b integers, then:

$$(a+b)^p \equiv a^p + b^p \pmod{p}$$

Lemma: Let p be a prime number and a an integer. The inverse of a modulo p is a^{p-2} :

$$a^{-1} \equiv a^{p-2} \pmod{p}$$

Taking modulo at the exponent

If a and m are coprime, then

$$a^n \equiv a^{n \bmod \varphi(m)} \pmod{m}$$

Generally, if $n \geq \log_2 m$, then

$$a^n \equiv a^{\varphi(m) + [n \bmod \varphi(m)]} \pmod{m}$$

Mobius inversion

If $g(n) = \sum_{d|n} f(d)$, then $f(n) = \sum_{d|n} g(d) \mu(\frac{n}{d})$.

A more useful definition is: $\sum_{d|n} \mu(d) = [n=1]$

Example, sum of LCM:

$$\begin{aligned} \sum_{i=1}^n \sum_{j=1}^n \text{lcm}(i, j) &= \sum_{k=1}^n \sum_{i=1}^n \sum_{j=1}^n [\gcd(i, j) = k] \frac{ij}{k} \\ &= \sum_{k=1}^n \sum_{a=1}^{\lfloor \frac{n}{k} \rfloor} \sum_{b=1}^{\lfloor \frac{n}{k} \rfloor} [\gcd(a, b) = 1] abk \\ &= \sum_{k=1}^n k \sum_{a=1}^{\lfloor \frac{n}{k} \rfloor} a \sum_{b=1}^{\lfloor \frac{n}{k} \rfloor} b [d|a] [d|b] \mu(d) \\ &= \sum_{k=1}^n k \sum_{d=1}^{\lfloor \frac{n}{k} \rfloor} \mu(d) \left(\sum_{a=1}^{\lfloor \frac{n}{kd} \rfloor} [d|a] a \right) \left(\sum_{b=1}^{\lfloor \frac{n}{kd} \rfloor} [d|b] b \right) \\ &= \sum_{k=1}^n k \sum_{d=1}^{\lfloor \frac{n}{k} \rfloor} \mu(d) \left(\sum_{p=1}^{\lfloor \frac{n}{kd} \rfloor} p \right) \left(\sum_{q=1}^{\lfloor \frac{n}{kd} \rfloor} q \right) \end{aligned}$$

Chicken McNugget Theorem

Given two **coprime** numbers n, m , the largest number that cannot be written as a linear combination of them is $nm - n - m$.

- There are $\frac{(n-1)(m-1)}{2}$ non-negative integers that cannot be written as a linear combination of n and m ;
- For each pair $(k, nm - n - m - k)$, for $k \geq 0$, exactly one can be written.

Harmonic Lemma

This technique computes sums of the form $\sum_{i=1}^n f(\lfloor \frac{n}{i} \rfloor)$ in $O(\sqrt{n})$. The value of $\lfloor \frac{n}{i} \rfloor$ is constant over blocks. If we are at index l , the value $v = \lfloor \frac{n}{l} \rfloor$ remains constant up to index $r = \lfloor \frac{n}{v} \rfloor$. We can iterate through these blocks instead of individual indices.

```
long long sum = 0;
for (int l = 1, r; l <= n; l = r + 1) {
    int val = n / l;
    r = n / val;
    sum += (long long)(r - l + 1) * f(val);
}
```

Generalization: For sums like $\sum_{i=1}^n g(i) \cdot f(\lfloor \frac{n}{i} \rfloor)$, the contribution of a block $[l, r]$ is:

$$(G(r) - G(l-1)) \cdot f\left(\left\lfloor \frac{n}{l} \right\rfloor\right)$$

where $G(k)$ is the prefix sum $\sum_{i=1}^k g(i)$, which must be efficiently computable.

Goldbach's Conjecture

Every even integer greater than 2 is the sum of two prime numbers. Verified for all even numbers up to 4×10^{18}

1.3 Combinatória

Stars and Bars Bounded

De quantas formas podemos definir uma sequencia x tal que:

$$\begin{aligned} \sum_{i=0}^n x_i &= M \\ l_i \leq x_i &\leq r_i \end{aligned}$$

Existência de solução A existência de solução é garantida se e somente se:

$$\sum_{i=0}^n l_i \leq M \leq \sum_{i=0}^n r_i$$

Solução com DP em $O(NM^2)$

$$DP(N, M) = \sum_{i=l_n}^{r_n} DP(N-1, M-i)$$

$$DP(0, M) = \begin{cases} 0, & M \neq 0 \\ 1, & M = 0 \end{cases}$$

Caso Particular $l_i = 0, r_i = M$ Stars and Bars com N-1 Barras

$$Resposta = \binom{M+N-1}{M}$$

Redução do problema para $l_i = 0$

$$M \leftarrow M - \sum_{i=0}^n l_i$$

$$x_i \leftarrow x_i - l_i$$

$$r_i \leftarrow r_i - l_i$$

$$l_i \leftarrow 0$$

Caso Especial $r_i = R$

$$Resposta = \sum_{k=0}^N (-1)^k \binom{N}{k} \binom{M - (R+1)k + N - 1}{N-1}$$

Formulas Básicas

Permutação Circular

O número de maneiras de ordenar n objetos distintos em um círculo.

$$PC_n = (n-1)!$$

Permutação com Repetição

O número de maneiras de ordenar n objetos, onde existem n_1 objetos idênticos de um tipo, n_2 de outro, e assim por diante.

$$P_n^{n_1, n_2, \dots, n_k} = \frac{n!}{n_1! n_2! \dots n_k!}$$

Combinação Caótica (Desarranjo)

O número de permutações de n objetos onde nenhum objeto permanece em sua posição original.

$$D_n = n! \sum_{k=0}^n \frac{(-1)^k}{k!}$$

Aproximação para n grande:

$$D_n \approx \frac{n!}{e}$$

Generalization for calculating number of elements in exactly r sets

A princípio da inclusão-exclusão pode ser reescrita para calcular o número de elementos que estão presentes em zero conjuntos:

$$\left| \bigcap_{i=1}^n A_i \right| = \sum_{m=0}^n (-1)^m \sum_{|X|=m} \left| \bigcap_{i \in X} A_i \right|$$

Considere sua generalização para calcular o número de elementos que estão presentes em exatamente r conjuntos:

$$\left| \bigcup_{|B|=r} \left[\bigcap_{i \in B} A_i \cap \bigcap_{j \notin B} A_j \right] \right| = \sum_{m=r}^n (-1)^{m-r} \binom{m}{r} \sum_{|X|=m} \left| \bigcap_{i \in X} A_i \right|$$

- **Catalan:** $C_n = \frac{1}{n+1} \binom{2n}{n}$. 1, 1, 2, 5, 14, 42.
- **Stirling 2:** $S(n, k) = kS(n-1, k) + S(n-1, k-1)$.
- **Vandermonde:** $\sum_{k=0}^r \binom{n}{k} \binom{m}{r-k} = \binom{n+m}{r}$.
- **Hockey-Stick:** $\sum_{i=r}^n \binom{i}{r} = \binom{n+1}{r+1}$.

crivo.h

Description: Crivo (Sieve) + Fatoração. Precomputa primos e menor divisor primo. `factorize(n)` retorna os fatores primos de n com suas frequências.

Time: $O(n \log \log n)$ para o crivo, $O(\log n)$ por fatoração

```
struct Sieve{
    int maxn;
    vector<int> is_prime, min_div;
    Sieve(int n){
        this->maxn = n;
        is_prime.assign(n+1, 1);
        min_div.resize(n+1);

        for(int i = 0; i <= n; i++){
            min_div[i] = i;
        }

        is_prime[0] = is_prime[1] = 0;
        for (int i = 2; i <= n; i++) {
            if (is_prime[i] && (long long)i * i <= n) {
                for (int j = i * i; j <= n; j += i){
                    if(is_prime[j]) min_div[j] = i;
                    is_prime[j] = false;
                }
            }
        }
    }
};
```

```
    }
}

vector<pair<int,int>> factorize(int n){
    assert(n <= maxn);
    vector<pair<int,int>> fact;
    while(n > 1){
        if(fact.empty() || fact.back().first !=
            min_div[n]){
            fact.push_back({min_div[n], 1});
        }else{
            fact.back().second += 1;
        }
        n /= min_div[n];
    }
    return fact;
};
```

CRT.h

Description: Teorema Chinês do Resto (Generalizado). Combina equações $x \equiv a \pmod{m}$. Os módulos m não precisam ser coprimos. Se não houver solução, retorna $a = -1$.

Time: $O(\log m)$ por equação

```
template<typename T> tuple<T, T, T> ext_gcd(T a, T b) {
    if (!a) return {b, 0, 1};
    auto [g, x, y] = ext_gcd(b%a, a);
    return {g, y - b/a*x, x};
}

template<typename T = ll> struct crt {
    T a, m;

    crt() : a(0), m(1) {}
    crt(T a_, T m_) : a(a_), m(m_) {}
    crt operator * (crt C) {
        auto [g, x, y] = ext_gcd(m, C.m);
        if ((a - C.a) % g) a = -1;
        if (a == -1 || C.a == -1) return crt(-1, 0);
        T lcm = m/g*C.m;
        T ans = a + (x*(C.a-a)/g % (C.m/g))*m;
        return crt((ans % lcm + lcm) % lcm, lcm);
    }
};
```

EuclidesEstendido.h

Description: Algoritmo de Euclides Estendido. Retorna $\gcd(a, b)$, e coeficientes x, y tais que $ax + by = \gcd(a, b)$.

Time: $O(\log(\min(a, b)))$

```
int egcd(int a, int b, int& x, int& y) {
    if (b == 0) {
        x = 1;
        y = 0;
        return a;
    }
    int x1, y1;
    int d = egcd(b, a % b, x1, y1);
    x = y1;
    y = x1 - y1 * (a / b);
    return d;
}
```

FFT.h

Description: FFT para convolução de polinômios. `fft(a)` computa $\hat{f}(k) = \sum_x a[x] \exp(2\pi i k x / N)$. N deve ser potência de 2. $\text{conv}(a, b) = c$, onde $c[x] = \sum_i a[i] b[x-i]$. $\text{convMod} < M >$ para convolução módulo M usando FFT de alta precisão. Arredondamento é seguro se $(\sum a_i^2 + \sum b_i^2) \log_2 N < 9 \cdot 10^{14}$. **Time:** $O(N \log N)$ com $N = |A| + |B|$

```
struct FFT{
    typedef complex<double> C;
    typedef vector<double> vd;
    typedef vector<long long int> vl;
    typedef vector<int> vi;

}

```

2 Geometria

2.1 Pythagorean Triples

For all natural a, b, c satisfying $a^2 + b^2 = c^2$ there exist $m, n \in \mathbb{N}$ and $m > n$ such that (reverse is also true):

$$a = m^2 - n^2 \quad b = 2mn \quad c = m^2 + n^2$$

2.2 Heron's Formula

The area of a triangle can be written as $A = \sqrt{s(s-a)(s-b)(s-c)}$, where a, b, c are the lengths of its sides and $s = \frac{a+b+c}{2}$.

This can be generalized to compute the area A of a quadrilateral with sides a, b, c, d , with $s = \frac{a+b+c+d}{2}$ and α, γ any two opposite angles:

$$A = \sqrt{(s-a)(s-b)(s-c)(s-d) - abcd \left(\cos^2 \left(\frac{\alpha + \gamma}{2} \right) \right)}$$

2.3 Pick's Theorem

The area of a simple polygon whose vertices have integer coordinates is:

$$A = I + \frac{B}{2} - 1$$

where I is the number of interior integer points, and B is the number of integer points in the border of the polygon.

2.4 Colinear Points

Three points are colinear on $\mathbb{R}^2$ iff:

$$\begin{vmatrix} x_A & y_A & 1 \\ x_B & y_B & 1 \\ x_C & y_C & 1 \end{vmatrix} = 0$$

The absolute value of this determinant is twice the area of the triangle ABC .

2.5 Coplanar Points

Four points are coplanar in $\mathbb{R}^3$ iff:

$$\begin{vmatrix} x_A & y_A & z_A & 1 \\ x_B & y_B & z_B & 1 \\ x_C & y_C & z_C & 1 \\ x_D & y_D & z_D & 1 \end{vmatrix} = 0$$

2.6 Trigonometry

Angle Sum

$$\sin(a \pm b) = \sin a \cos b \pm \cos a \sin b$$

$$\cos(a \pm b) = \cos a \cos b \mp \sin a \sin b$$

$$\tan(a \pm b) = \frac{\tan a \pm \tan b}{1 \mp \tan a \tan b}$$

Sum-to-Product Transformation

$$\sin a \pm \sin b = 2 \sin \frac{a \pm b}{2} \cos \frac{a \mp b}{2}$$

$$\cos a + \cos b = 2 \cos \frac{a+b}{2} \cos \frac{a-b}{2}$$

$$\cos a - \cos b = -2 \sin \frac{a+b}{2} \sin \frac{a-b}{2}$$

$$\tan a \pm \tan b = \frac{\sin(a \pm b)}{\cos a \cos b}$$

2.7 Centroid of a polygon

The coordites of the centroid of a non-self-intersecting closed polygon is:

$$\frac{1}{3A} \left(\sum_{i=0}^{n-1} (x_i + x_{i+1})(x_i y_{i+1} - x_{i+1} y_i), \sum_{i=0}^{n-1} (y_i + y_{i+1})(x_i y_{i+1} - x_{i+1} y_i) \right)$$

where A is twice the signed area of the polygon.

2.8 Geometria Básica

Formas 2D

- **Triângulo:** $A = \frac{bh}{2} = \sqrt{s(s-a)(s-b)(s-c)}$, $s = \frac{a+b+c}{2}$
- **Círculo:** $C = 2\pi r = \pi d$ $A = \pi r^2$
- **Quadrado/Retângulo:** $A = s^2$ / $A = lw$ $P = 4s$ / $P = 2(l + w)$
- **Paralelogr./Trap.:** $A = bh$ $A = \frac{(a+b)h}{2}$

Formas 3D

- **Esfera:** $V = \frac{4}{3}\pi r^3$ $SA = 4\pi r^2$
- **Cilindro:** $V = \pi r^2 h$ $SA = 2\pi r(h + r)$, $L = 2\pi r h$
- **Cone:** $V = \frac{1}{3}\pi r^2 h$ $L = \pi r \sqrt{r^2 + h^2}$
- **Cubo/Prisma:** $V = s^3$ / $V = lwh$ $SA = 6s^2$ / $SA = 2(lw + lh + wh)$
- **Pirâmide:** $V = \frac{1}{3}A_b h$ (A_b : área da base)

Compare.h

3 Strings

3.1 Number of Distinct Substrings ($O(n^2)$):

A classic solution is to iterate through all n suffixes $S[i..]$. For each suffix, we compute its Z-function in $O(n)$. The largest $Z[j]$ value found for this suffix represents the LCP (Longest Common Prefix) with another suffix $S[j..]$ that starts later. The number of *new* substrings introduced at i is the length of the suffix $(n - i)$ minus

the largest Z value found. The total sum gives us the number of distinct substrings.

3.2 Matching with $\leq k$ consecutive errors ($O(n)$):

To find a pattern P in a text T (length n) allowing a block of up to k consecutive errors, we use the Z-function twice.

1. Compute $Z(P + '$' + T)$ to find the LCP of P with each suffix $T[i..]$. This gives us $\text{lcp}[i]$, the length of the match *before* the first mismatch.
2. Compute $Z(P^R + '$' + T^R)$ (reversed strings). This allows us to find the LCS (Longest Common Suffix) of P ending at each position j in the text, let's call it $\text{lcs}[j]$.

A valid occurrence of P starts at $T[i]$ if the sum of the prefix match and the suffix match covers almost the entire pattern, i.e.: $\text{lcp}[i] + \text{lcs}[i + |P| - 1] \geq |P| - k$.

ahocorasick.h

Description: aho

Usage: query retorna o somatorio do numero de matches de todas as stringuinhas na stringona

Time: $O(n)$, onde n é o tamanho da string

```
namespace aho {
    map<char, int> to[MAX];
    int link[MAX], idx, term[MAX], exit[MAX], sobe[MAX];

    void insert(string& s) {
        int at = 0;
        for (char c : s) {
            auto it = to[at].find(c);
            if (it == to[at].end()) at = to[at][c] = ++idx;
            else at = it->second;
        }
        term[at]++, sobe[at]++;
    }

    #warning nao esquece de chamar build() depois de inserir
    void build() {
        queue<int> q;

            l = i;
        }
    }
    return z;
}
```

4 Grafos

4.1 Min Cut Max Flow Duality

We seek to construct a binary string S of length n that minimizes a total cost. The cost is defined as follows:

- If $S_i = 0$, a cost of A_i is incurred.
- If $S_i = 1$, a cost of B_i is incurred.
- If $S_i = 1$ and $S_j = 0$, a penalty of $C_{i,j}$ is incurred.

The total cost is the sum of all such costs and penalties for the chosen string S .

1. For each node i , add an edge $s \rightarrow i$ with capacity B_i . This represents the cost of setting $S_i = 1$.
2. For each node i , add an edge $i \rightarrow t$ with capacity A_i . This represents the cost of setting $S_i = 0$.
3. For each pair (i, j) with a penalty, add an edge $i \rightarrow j$ with capacity $C_{i,j}$. This represents the penalty for setting $S_i = 1$ and $S_j = 0$.

The capacity of a cut in this graph corresponds to the total cost of the binary string defined by the partition. For example, if node i is in the T -partition ($S_i = 1$) and node j is in the S -partition ($S_j = 0$), the edge $i \rightarrow j$ must be cut, adding the penalty $C_{i,j}$ to the total cost. By the max-flow min-cut theorem, the minimum cost is equal to the maximum flow from s to t .

4.2 Notable Applications and Equivalences on Flow

• Bipartite Matching:

The size of the maximum matching in a bipartite graph is equal to the maximum flow in a network constructed from the graph.

• König's Theorem:

In any bipartite graph, the number of edges in the maximum

matching is equal to the number of vertices in the minimum vertex cover.

Maximum Matching = Minimum Vertex Cover

Maximum Independent Set = $|V| - \text{Maximum Matching}$

• Menger's Theorem:

The maximum number of vertex-disjoint paths between two vertices u, v is equal to the minimum number of vertices to be removed to disconnect u and v .

• Project Selection Problem (Min-Cut):

Binary decision problems with interdependent costs and profits can be modeled as a minimum cut problem, where the cut separates the "chosen" decisions from the "not chosen" ones.

4.3 Game Theory

Impartial Games (Normal Play): Último a jogar vence.

- **Nim-Sum:** $G = p_1 \oplus p_2 \oplus \dots \oplus p_k$.
- **P-position (Losing):** $G = 0$. **N-position (Winning):** $G \neq 0$.
- **Sprague-Grundy:** Qualquer estado S equivale a uma pilha de Nim de tamanho $g(S)$.
- **Cálculo de $g(S)$:** $g(S) = \text{mex}(\{g(S') \mid S \rightarrow S'\})$.
- **Soma de Jogos:** $g(G_1 + \dots + G_k) = g(G_1) \oplus \dots \oplus g(G_k)$.
- **Movimento de Divisão:** Se uma jogada divide o jogo em subjogos A e B , o valor de Grundy dessa jogada é $g(A) \oplus g(B)$. O $g(S)$ final será o MEX de todos os valores de jogadas possíveis.
- **Subtraction Games:** $g(n) = \text{mex}(\{g(n - s_i) \mid s_i \in S\})$. Costuma ser periódico; procure o ciclo para n grandes.
- **Misere Play:** Último a jogar PERDE. No Nim, jogue normalmente até que reste apenas uma pilha de tamanho > 1 . Nesse momento, mova para deixar um número ÍMPAR de pilhas de tamanho 1.

Green Hackenbush:

- **Em Árvore:** $g(\text{node}) = \bigoplus (g(\text{filho}) + 1)$.
- **Colon Principle:** Quando arestas se encontram em um vértice, substitua por uma única aresta com valor $g = \text{XOR}$ dos Grundy das arestas originais.

2Sat.h

Description: 2-SAT solver. Resolve equações do tipo $(a \vee b) \wedge (c \vee d) \dots$

Cláusula $(+a \vee -b)$ vira `add_edge(1, a, 0, b)`.

Usage: `add_edge(1, a, 0, b)` para $(+a \vee -b)$.

Time: $O(n + m)$, onde n = variáveis, m = implicações

EulerPath.h

Description: Eulerian undirected/directed path/cycle algorithm. Input should be a vector of (dest, global edge index), where for undirected graphs, forward/backward edges have the same index. Returns a list of nodes in the Eulerian path/cycle with src at both start and end, or empty list if no cycle/path exists. To get edge indices back, add .second to s and ret.

Time: $O(V + E)$

```

vector<int> eulerWalk(vector<vector<pii>>& gr, int nedges,
    int src=0) {
    int n = gr.size();
    vector<int> D(n), its(n), eu(nedges), ret, s = {src};
    D[src]++; // to allow Euler paths, not just cycles
    while (!s.empty()) { //start-hash
        int x = s.back(), y, e, &it = its[x], end =
            int(gr[x].size());
        if (it == end){ ret.push_back(x); s.pop_back(); continue; }
        tie(y, e) = gr[x][it++];
        if (!eu[e]) D[x]--, D[y]++, eu[e] = 1, s.push_back(y);
    } //end-hash
    for(auto &x : D) if (x < 0 || int(ret.size()) != nedges+1)
        return {};
    return {ret.rbegin(), ret.rend()};
}

```

FloydWarshall.h

Description: Floyd-Warshall para caminhos mínimos entre todos os pares. Se houver ciclos negativos, para algum vértice $a \rightarrow dist[a][a] < 0$.

Time: $O(n^3)$

```

struct FloydWarshall {
    const int MAXN = 500;
    const ll INF = 1e18;
};

```

```

vector<int> dist(maxn, vector<ll>(maxn, INF));

    return val[a] + val[b] + lift(a, height[a] -
        height[l]).second + lift(b, height[b] -
        height[l]).second - val[l];
}
};

```

VirtualTree.h

Description: Virtual Tree. Dado um conjunto de vértices, constrói uma árvore minimal contendo esse conjunto. A virtual tree possui no máximo $2|V| - 1$ vértices.

Usage: virt[i] guarda os vizinhos do vértice i (pares: vértice, distância). build(v) retorna a raiz da virtual tree.

Time: $O(N \log N)$, sendo N o tamanho do conjunto de vértices passados.

```

vector<pair<int, int> > virt[mxn];

int build(vector<int> v){
    auto cmp = [&](int a, int b) {return tempo[a]<tempo[b];};
    sort(v.begin(), v.end(), cmp);
    for(int i=(int)v.size()-1; i>0; i--){
        v.push_back(lca(v[i], v[i-1]));
    }
    sort(v.begin(), v.end(), cmp);
    v.erase(unique(v.begin(), v.end()), v.end());
    for(int i=0; i<v.size(); i++) virt[v[i]].clear();
    for(int i=1; i<v.size(); i++) virt[lca(v[i],
        v[i-1])].clear();
    for(int i=1; i<v.size(); i++){
        int pai = lca(v[i], v[i-1]);
        int d = dist(pai, v[i]);
        virt[pai].emplace_back(v[i], d);
    }
    return v[0];
}

```

6 DataStructures

BIT.h

Description: Fenwick Tree (BIT) para range sum com update pontual. Suporta função associativa com inversos em um conjunto com elemento neutro. Para máximo: apenas update de incremento (só é possível aumentar valores).

Time: $O(\log n)$ por query/update

```

struct FenwickTree {
    vector<int> bit;
    int n;

    FenwickTree(int n) {
        this->n = n;
        bit.assign(n, 0);
    }

    FenwickTree(vector<int> const &a) : FenwickTree(a.size()){
        for (int i = 0; i < n; i++) {
            bit[i] += a[i];
            int r = i | (i + 1);
            if (r < n) bit[r] += bit[i];
        }
    }

    int sum(int r) {

                    l = l + (1<<i);
                }
            }

            return neutral;
        }
    };
};

```

7 DP

Bitmask.h

Description: Itera sobre todos os subconjuntos estritos de uma máscara (Submask DP).
Time: $O(3^n)$

```

for (int mask = 0; mask < (1 << n); mask++) {
    for (int submask = mask; submask != 0; submask = (submask
        ↪ - 1) & mask) {
        int subset = mask ^ submask;
    }
}

```

```

    }
    // do whatever you need to do here
}

```

DcDp.h

Description: Divide and Conquer DP. Particiona um array em k subarrays minimizando a soma das queries. Assume que $\text{query}(l, r)$ é $O(1)$.

Usage: $\text{DC}(n, k)$ retorna o custo mínimo de particionar n elementos em k subarrays. O usuário deve implementar $\text{query}(l, r)$ que retorna o custo do subarray $[l, r]$.

Time: $O(kn \log n)$

```

11 dp[MAX][2];

void solve(int k, int l, int r, int lk, int rk) {
    if (l > r) return;
    int m = (l+r)/2, p = -1;
    auto& ans = dp[m][k&1] = LINF;
    for (int i = max(m, lk); i <= rk; i++) {
        ll at = dp[i+1][~k&1] + query(m, i);
        if (at < ans) ans = at, p = i;
    }
    solve(k, l, m-1, lk, p), solve(k, m+1, r, p, rk);
}

11 DC(int n, int k) {
    dp[n][0] = dp[n][1] = 0;
    for (int i = 0; i < n; i++) dp[i][0] = LINF;
    for (int i = 1; i <= k; i++) solve(i, 0, n-i, 0, n-i);
    return dp[0][k&1];
}

```

DigitDp.h

Description: Digit DP template. Exemplo: números sem dois dígitos adjacentes iguais. $\text{func}(a, b)$ retorna a quantidade de números no intervalo $[a, b]$.

Usage: O usuário deve modificar a condição dentro do loop em solve para implementar a restrição desejada sobre os dígitos.

Time: $O(d \cdot 10)$ onde d é o número de dígitos

```

11 solve(string &s, int i, int tight, int last, int started){
    if(i==(int)s.size()) return 1;

    if(!tight && dp[i][last][started]!=-1) return
    ↪ dp[i][last][started];

    int lim=(tight?s[i]-'0':9);

    11 resp=0;
    for(int j=0; j<=lim; j++){
        if(started && j==last) continue;
        resp+=solve(s, i+1, tight&(j==lim), j, (started|j)>0);
    }

    if(!tight) return dp[i][last][started]=resp;
    return resp;
}

11 func(11 a, 11 b){
    string agr1=to_string(a-1);
    memset(dp, -1, sizeof(dp));
    11 ans1 = solve(agr1, 0, 1, 10, 0);

    string agr2=to_string(b);
    memset(dp, -1, sizeof(dp));

```

```

    11 ans2 = solve(agr2, 0, 1, 10, 0);

    return ans2-ans1;
}

```

Sos.h

Description: Sum over Subsets (SOS) DP. Dado um array A de 2^N inteiros, calcula $F[\text{mask}] = \sum_{i \subseteq \text{mask}} A[i]$.

Time: $O(N \cdot 2^N)$

```

for(int i = 0; i < (1<<N); ++i)
    F[i] = A[i];
for(int i = 0; i < N; ++i) for(int mask = 0; mask < (1<<N);
    ↪ ++mask){
    if(mask & (1<<i))
        F[mask] += F[mask^(1<<i)];
}

```

SubsetSum.h

Description: Subset Sum com bounded knapsack otimizado por sliding window. Soma desejada = S , números = n . Itens não podem ter valor 0 nem frequência 0.

Usage: sack é um vetor de pares {item, frequência}. $\text{dp}[x] = 1$ se é possível obter soma x , 0 caso contrário.

Time: $O(S\sqrt{n})$ runtime, $O(n)$ memory

```

vector<pair<int,int>> sack; // {item, frequency}
vector<int> dp(S+1, 0);
dp[0] = 1;

for(int i = 0; i < sack.size(); i++){
    vector<int> ndp(S+1);
    auto [item, freq] = sack[i];
    for(int j = 0; j < item; j++){ //starting at position j
        int numTrues = 0;
        for(int k = j; k <= S; k += item){
            ndp[k] = dp[k];
            if(numTrues > 0) ndp[k] = true;
            if(k - freq*item >= 0) numTrues -= dp[k -
            ↪ freq*item];
            numTrues += dp[k];
        }
    }
    swap(ndp, dp);
}

```

8 Extra

8.1 String Matching with Wildcards

Consider a text T and a pattern P . P and T may have wildcards that will match any character. The problem is to get the positions where P occur in T .

If we define the value of the characters such that the wildcard is zero and the other characters are positive, there is a matching at position i iff $\sum_{j=0}^{|P|-1} P[j]T[i+j](P[j]-T[i+j])^2 = 0$. Then, one can evaluate each term of

$$\sum_{j=0}^{|P|-1} (P[j]^3 T[i+j] - 2P[j]^2 T[i+j]^2 + P[j]T[i+j]^3)$$

using three convolutions.

2pointer.h

Description: Técnica dos dois ponteiros (Two-Pointer). Modelos para: (1) Maior segmento bom (segmentos bons são fechados sob aninhamento). (2) Menor segmento bom (segmentos bons são fechados sob contenção). Inclui notas sobre quando aplicar o método.

Time: $O(n)$

```

x = 0, L = 0
for R = 0..n-1
    x += a[R]
    while x > s:
        x -= a[L]
        L++
    res = max(res, R - L + 1)

```

```

x = 0, L = 0
for R = 0..n-1
    x += a[R]
    while x - a[L] >= s:
        x -= a[L]
        L++
    if x >= s:
        res = min(res, R - L + 1)

```

Suppose you received a problem at the contest in which you
 ↪ need to do something similar: find the longest (shortest)
 ↪ good segment or count the number of good segments.
 How do you know if you can apply the two-pointer method to it?
 First, one of the following two properties must be met:

```

    if the segment [L,R] is good, then any segment nested in
    ↪ it is also good (in this case, you can apply the code
    ↪ from the first problem);
    if the segment [L,R] is good, then any segment that
    ↪ contains it is also good (in this case, you can apply
    ↪ the code from the second problem).

```

Secondly, you should be able to recalculate your function
 ↪ (check if current segment is good or bad), while moving
 ↪ the left or right border by one to the right.
 In such tasks, the code almost always looks like this:

```

L = 0
for R = 0..n-1
    add(a[R])
    while not good():
        remove(a[L])
        L++

```

BitOperators.h

Description: Operações bit a bit built-in, Gray Code e identidades bitwise. `__builtin_clz`, `__builtin_ctz`, `__builtin_popcount`, `__builtin_parity`. Gray code: $g(n) = n \oplus (n \gg 1)$ e sua inversa.

Time: $O(1)$ por operação

Pra fazer funcionar com `long long` é só colocar `11` no `final` da
 ↪ função, por exemplo `"__builtin_clz(x)"` vira
 ↪ `"__builtin_clzll(x)"`
`__builtin_clz(x)`: Count leading zeros. Retorna o número de
 ↪ zeros no início da representação binária de x (início ==
 ↪ bits mais significativos)
`__builtin_ctz(x)`: Count trailing zeros. Retorna o número de
 ↪ zeros no `final` da representação binária de x
`__builtin_popcount(x)`: Population count. Retorna o número de
 ↪ bits definidos como `1` na representação binária de x

```
__builtin_parity(x): Parity. Retorna 1 se o número de bits
→ definidos como 1 for ímpar e 0 se for par.
int L = 32 - __builtin_clz(n), n = 1 << L; : "n" se torna a
→ primeira potencia de 2 estritamente maior que n
```

```
// I-ésimo numero do GrayCode
```

```
int g (int n) {
    return n ^ (n >> 1);
}
```

```
// GrayCode Reverso
```

```
int rev_g (int g) {
    int n = 0;
    for (; g; g >>= 1)
        n ^= g;
    return n;
}
```

Some properties of bitwise operations:

```
a|b = a^b + a&b
a^(a&b) = (a|b)^b
b^(a&b) = (a|b)^a
(a&b)^(a|b) = a^b
```

Addition:

```
a+b = a|b + a&b
a+b = a^b + 2(a&b)
```

Subtraction:

```
a-b = (a^(a&b))-((a|b)^a)
a-b = ((a|b)^b)-((a|b)^a)
a-b = (a^(a&b))-(b^(a&b))
a-b = ((a|b)^b)-(b^(a&b))
```

Brute.h

Description: Script bash para stress testing. Compila code, brute e gen, gera testes com seeds crescentes e compara as saídas com diff. Para no primeiro WA e imprime o caso falho.

Time: N/A

```
set -e
g++ code.cpp -o code
g++ brute.cpp -o brute
g++ gen.cpp -o gen
for((i = 1; ; ++i)) do
    echo "Test: " $i
    ./gen $i > input_file
    cat input_file
    ./code < input_file > myAnswer
    ./brute < input_file > correctAnswer
    diff -Z myAnswer correctAnswer > /dev/null || break
    cat input_file
    cat myAnswer
    cat correctAnswer
    echo "Passed test" $i
done
echo "WA:"
cat input_file
echo "My:"
cat myAnswer
echo "correct:"
cat correctAnswer
```

CoordinateCompression.h

Description: Compressão de coordenadas. Mapeia valores de um array para inteiros consecutivos $[0, k]$, preservando a ordem relativa.

Usage: Para recuperar o valor original: `d[arr[i]].`

Time: $O(N \log N)$

```
vector<int> d = arr;
sort(d.begin(), d.end());
d.resize(unique(d.begin(), d.end()) - d.begin());
for (int i = 0; i < n; ++i) {
    arr[i] = lower_bound(d.begin(), d.end(), arr[i]) -
        → d.begin();
}
```

Gen.h

Description: Template de gerador de testes aleatórios usando mt19937. Gera valores inteiros uniformemente distribuídos em um intervalo.

Time: N/A

```
#include <bits/stdc++.h>
using namespace std;
typedef long long ll;
```

```
mt19937 rng((uint32_t)chrono::steady_clock::now().time_since_
→ epoch().count());
```

```
int main(){
    cin.tie(0), ios_base::sync_with_stdio(false);
    int n = uniform_int_distribution<int> (1, 3)(rng);
}
```

Makefile.h

Description: Template de Makefile com warnings e sanitizers para programação competitiva.

Usage: make a

Time: N/A

```
WARNINGS := -Wshift-overflow=2 -Wfloat-equal -Wconversion
SANITIZERS := -fsanitize=address -D_GLIBCXX_DEBUG
→ -D_GLIBCXX_DEBUG_PEDANTIC -fsanitize=undefined
a.out: a.cpp
    g++ -Dlocal $(WARNINGS) $(SANITIZERS) a.cpp
```

orderedSet.h

Description: Ordered set e multiset usando GNU PBDS. Suporta `order_of_key` (rank) e `find_by_order` (k-ésimo elemento).

Time: $O(\log n)$ por operação

```
#include <ext/pb_ds/tree_policy.hpp>
#include <ext/pb_ds/assoc_container.hpp>
using namespace __gnu_pbds;
using ordered_set = tree<ll, null_type, less<ll>,
→ rb_tree_tag, tree_order_statistics_node_update>;
using ordered_multiset = tree<ll, null_type, less_equal<ll>,
→ rb_tree_tag, tree_order_statistics_node_update>;
```

TernarySearch.h

Description: Busca ternária para funções discretas e contínuas. Encontra o menor $i \in [a, b]$ que maximiza $f(i)$, assumindo $f(a) < \dots < f(i) \geq \dots \geq f(b)$. Para minimizar, inverter as desigualdades. Para reais, usar $\approx 200-300$ iterações.

Usage: `int ind = ternSearch(0, n-1, [&](int i){ return a[i]; });`

Time: $O(\log(b-a))$

```
double ternary(double l, double r){
    // < for maximum and > for minimum value
    int cont = 300;
    while (cont --)
    {
        double m1 = l + (r-l)/3;
        double m2 = r - (r-l)/3;
        double f1 = f(m1);
        double f2 = f(m2);
        if(f1>f2){
            l = m1;
        }else{
            r = m2;
        }
    }
    return l;
}
```

```
/**
 * Author: Simon Lindholm
 * Date: 2015-05-12
 * License: CC0
 * Source: own work
 * Description:
 * Find the smallest i in  $[a, b]$  that maximizes  $f(i)$ ,
→ assuming that  $f(a) < \dots < f(i) \geq \dots \geq f(b)$ .
 * To reverse which of the sides allows non-strict
→ inequalities, change the < marked with (A) to <=, and
→ reverse
 * the loop at (B).
 * To minimize  $f(i)$ , change it to >, also at (B).
 * If you are dealing with real numbers, you'll need to pick
→  $m_1 = (2a + b)/3.0$  and  $m_2 = (a + 2b)/3.0$ .
 * Consider setting a constant number of iterations for the
→ search, usually  $[200, 300]$  iterations are sufficient
 * for problems with error limit as  $10^{-6}$ .
 * Status: tested
 * Usage: int ind = ternSearch(0, n-1, [&](int i){return
→ a[i];});
 * Time:  $O(\log(b-a))$ 
 */
```

```
int ternSearch(int a, int b) {
    assert(a <= b);
    while (b - a >= 5) {
        int mid = (a + b) / 2;
        if (f(mid) < f(mid+1)) a = mid; // (A)
        else b = mid+1;
    }
    for(int i = a+1; i <= b; ++i)
        if (f(a) < f(i)) a = i; // (B)
    return a;
}
```

XorBasis.h

Description: Xor Basis. Mantém uma base de vetores e permite reduzir um valor ao mínimo XOR com elementos da base. `mx(1)` retorna o máximo valor XOR usando elementos cujo segundo campo $\geq l$.

Time: $O(\log \text{MAX})$ por operação

```
struct Basis{
    long long neutral = (1ll << 31) - 1;
    vector <pair<int, int>> basis;
    Basis(){
    }
    void add(pair<int, int> x){
        for(auto& i : basis){
```

```
            x.first = min(x.first, x.first^i.first);
        }
        if(x.first != 0){
            basis.push_back(x);
        }
    }
    int mx(int l){
        long long x = neutral;
```

```
        for(auto& i : basis){
            if(i.second >= l){
                x = min(x, x^i.first);
            }
        }
        return x ^ neutral;
    }
};
```
